

Making your medications more effective through genetic testing

What is Pillcheck?

It's an easy DNA testing service that shows how your body will respond to different medications. It helps you avoid ineffective treatments and side effects so you feel better sooner.

99% of people have genetic variations that determine how they'll respond to drugs.

Easy and convenient

A DNA sample collection kit is sent to you. Swab your cheek and mail the sample back in the prepaid envelope. You don't need to be on any medications to benefit. Since your DNA doesn't change, your Pillcheck report remains useful in the future.

Private and secure

You'll receive your results in a secure online account. Your results are never shared without your consent and won't affect insurance decisions. Your DNA sample is destroyed after the test is complete.

Here's what people say about Pillcheck:

It has changed the way my illness is treated and has helped me immensely!

Confidence in your prescriptions

Pillcheck helps you and your doctor reduce the guesswork of medication selection. The service includes a personalized report and medication review by an expert pharmacist to guide your doctor in prescribing the right medications for your mental health, pain management, heart issues, and many more.

Therapy recommendations for you and your doctor

Evidence-based genetic prescribing recommendations

Your medication history, demographics and lifestyle

Expert Pharmacist Review makes evidence relevant for the individual

78% of prescriptions were changed based on Pillcheck results.

Personalized insights for life

You can share your Pillcheck report with any healthcare provider. The service is based on the latest scientific research and includes annual updates for new medications and guidelines.
